Information to the „bode.exe" - Program

Some years ago the following email arrived at the author to give some information and explanations to the "Bode.exe"-file. But still today this program seems to be interesting for users and so it is added to the „PUFF Installation File Package" on the CD.

Please start the **DOS-Shell**, call **„Edit** / **New entry**" to set the path and create an icon for it. The rest seems to be self-explaining -- please ignore all information about the graphic driver, because under Windows7 a screenshot is used for printing out the results (using the "Irfan View"-software included on the CD).

Gunthard Kraus

This was the email:

Dear OM Gunthard,

'I needed a program to create a phase diagram in addition to the simulated and shown magnitude of an S-Parameter. This information is important when designing oscillators to watch magnitude and phase together versus frequency.

Please use the egavga.bgi driver and vga2lasr.com for printing.

The program is given „as is" without any warranty and I would be pleased when the file is helpful for others. Also the source code is available on demand.

e-mail : DL2HWJ@t-online.de

Please go on with PUFF in this manner!
